Grade	**4.00** out of 4.00 (**100**%)

Question **1**

Correct

Mark 1.00 out of 1.00

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that A[j] - A[i] = k, i != j.

Input Format:

First Line n - Number of elements in an array

Next n Lines - N elements in the array

k - Non - Negative Integer

Output Format:

1 - If pair exists

0 - If no pair exists

Explanation for the given Sample Testcase:

YES as 5 - 1 = 4

So Return 1.

For example:

Input	Result
3 1 3 5 4	1

Answer: (penalty regime: 0 %)

```c
#include <stdio.h>

int findPairWithDifference(int arr[], int n, int k) {
    int i = 0, j = 1;

    while (j < n) {
        int diff = arr[j] - arr[i];

        if (diff == k) {
            return 1; // Pair found
        } else if (diff < k) {
            j++; // Increase j to make the difference larger
        } else {
            i++; // Increase i to make the difference smaller
            if (i == j) {
                j++; // Ensure i is not equal to j
            }
        }
    }

    return 0; // No pair found
}

int main() {
    int n, k;

    // Read input
    scanf("%d", &n); // Number of elements in the array
    int arr[n];

    for (int i = 0; i < n; i++) {
        scanf("%d", &arr[i]); // Array elements
    }

    scanf("%d", &k); // The given non-negative integer k

    // Call the function and output the result
    printf("%d\n", findPairWithDifference(arr, n, k));

    return 0;
```

```
41 }
```

	Input	Expected	Got	
✔	3 1 3 5 4	1	1	✔
✔	10 1 4 6 8 12 14 15 20 21 25 1	1	1	✔
✔	10 1 2 3 5 11 14 16 24 28 29 0	0	0	✔
✔	10 0 2 3 7 13 14 15 20 24 25 10	1	1	✔

Passed all tests! ✔

Correct

Marks for this submission: 1.00/1.00.
